# Comparison of short-term surgical outcomes with Intuitive da Vinci® vs. laparoscopic myomectomy

A single center (India) retrospective observational study evaluating and comparing the short-term surgical outcomes of robotic (n=21) and laparoscopic (n=14) myomectomy

**"RM (robotic myomectomy) is a comparatively safer and preferable procedure than LM (laparoscopic myomectomy) when it comes to the removal of bigger fibroids or fibroids at difficult locations like broad ligament fibroids"**

Larger average size of myoma in RM ( $9.2 \pm 1.3$  cm vs  $6.3 \pm 1.2$  cm)

Fibroids in  
**LM** group were  
Subserol type

Fibroids in  
**RM** group were  
Intramural type

RM associated with  
**higher rate of prior abdominal surgery**  
(66.7% vs. 35.8%)

**"RM was more efficient in the removal of multiple fibroids"**

**LM**

**RM**

Had more than or equal to two fibroids removed

# Important safety information

## **Important safety information**

Serious complications may occur in any surgery, including da Vinci surgery, up to and including death. Serious risks include, but are not limited to, injury to tissues and organs and conversion to other surgical techniques which could result in a longer operative time and/or increased complications. For summary of the risks associated with surgery refer to [www.davincisurgery.com/safety](http://www.davincisurgery.com/safety) or [www.intuitive.com/safety](http://www.intuitive.com/safety).

For product intended use and/or indications for use, risks, cautions, and warnings and full prescribing information, refer to the associated user manual(s) or visit <https://manuals.intuitivesurgical.com/market>.

Individual outcomes may depend on a number of factors—including but not limited to—patient characteristics, disease characteristics, and/or surgeon experience.

## **Da Vinci Xi/X system precaution statement**

The demonstration of safety and effectiveness for the representative specific procedures did not include evaluation of outcomes related to the treatment of cancer (overall survival, disease-free survival, local recurrence), except for radical prostatectomy which was evaluated for overall survival, or treatment of the patient's underlying disease/condition. Device usage in all surgical procedures should be guided by the clinical judgment of an adequately trained surgeon.
